

a,b: five permission scenarios; *40% and 60% require additional business assumptions. PV: $n = 100$, zero missed work.

b: paired 95% bootstrap intervals cover sampling, not optimisation error; tiny BESS effects are unresolved.

c,d: fixed 10% work eligibility. c: $n = 300$; one-sided 95% Wilson bounds. Hosting gains are differences of minima.
